Gauge-Higgs EW unification

Mature and ready for tests.

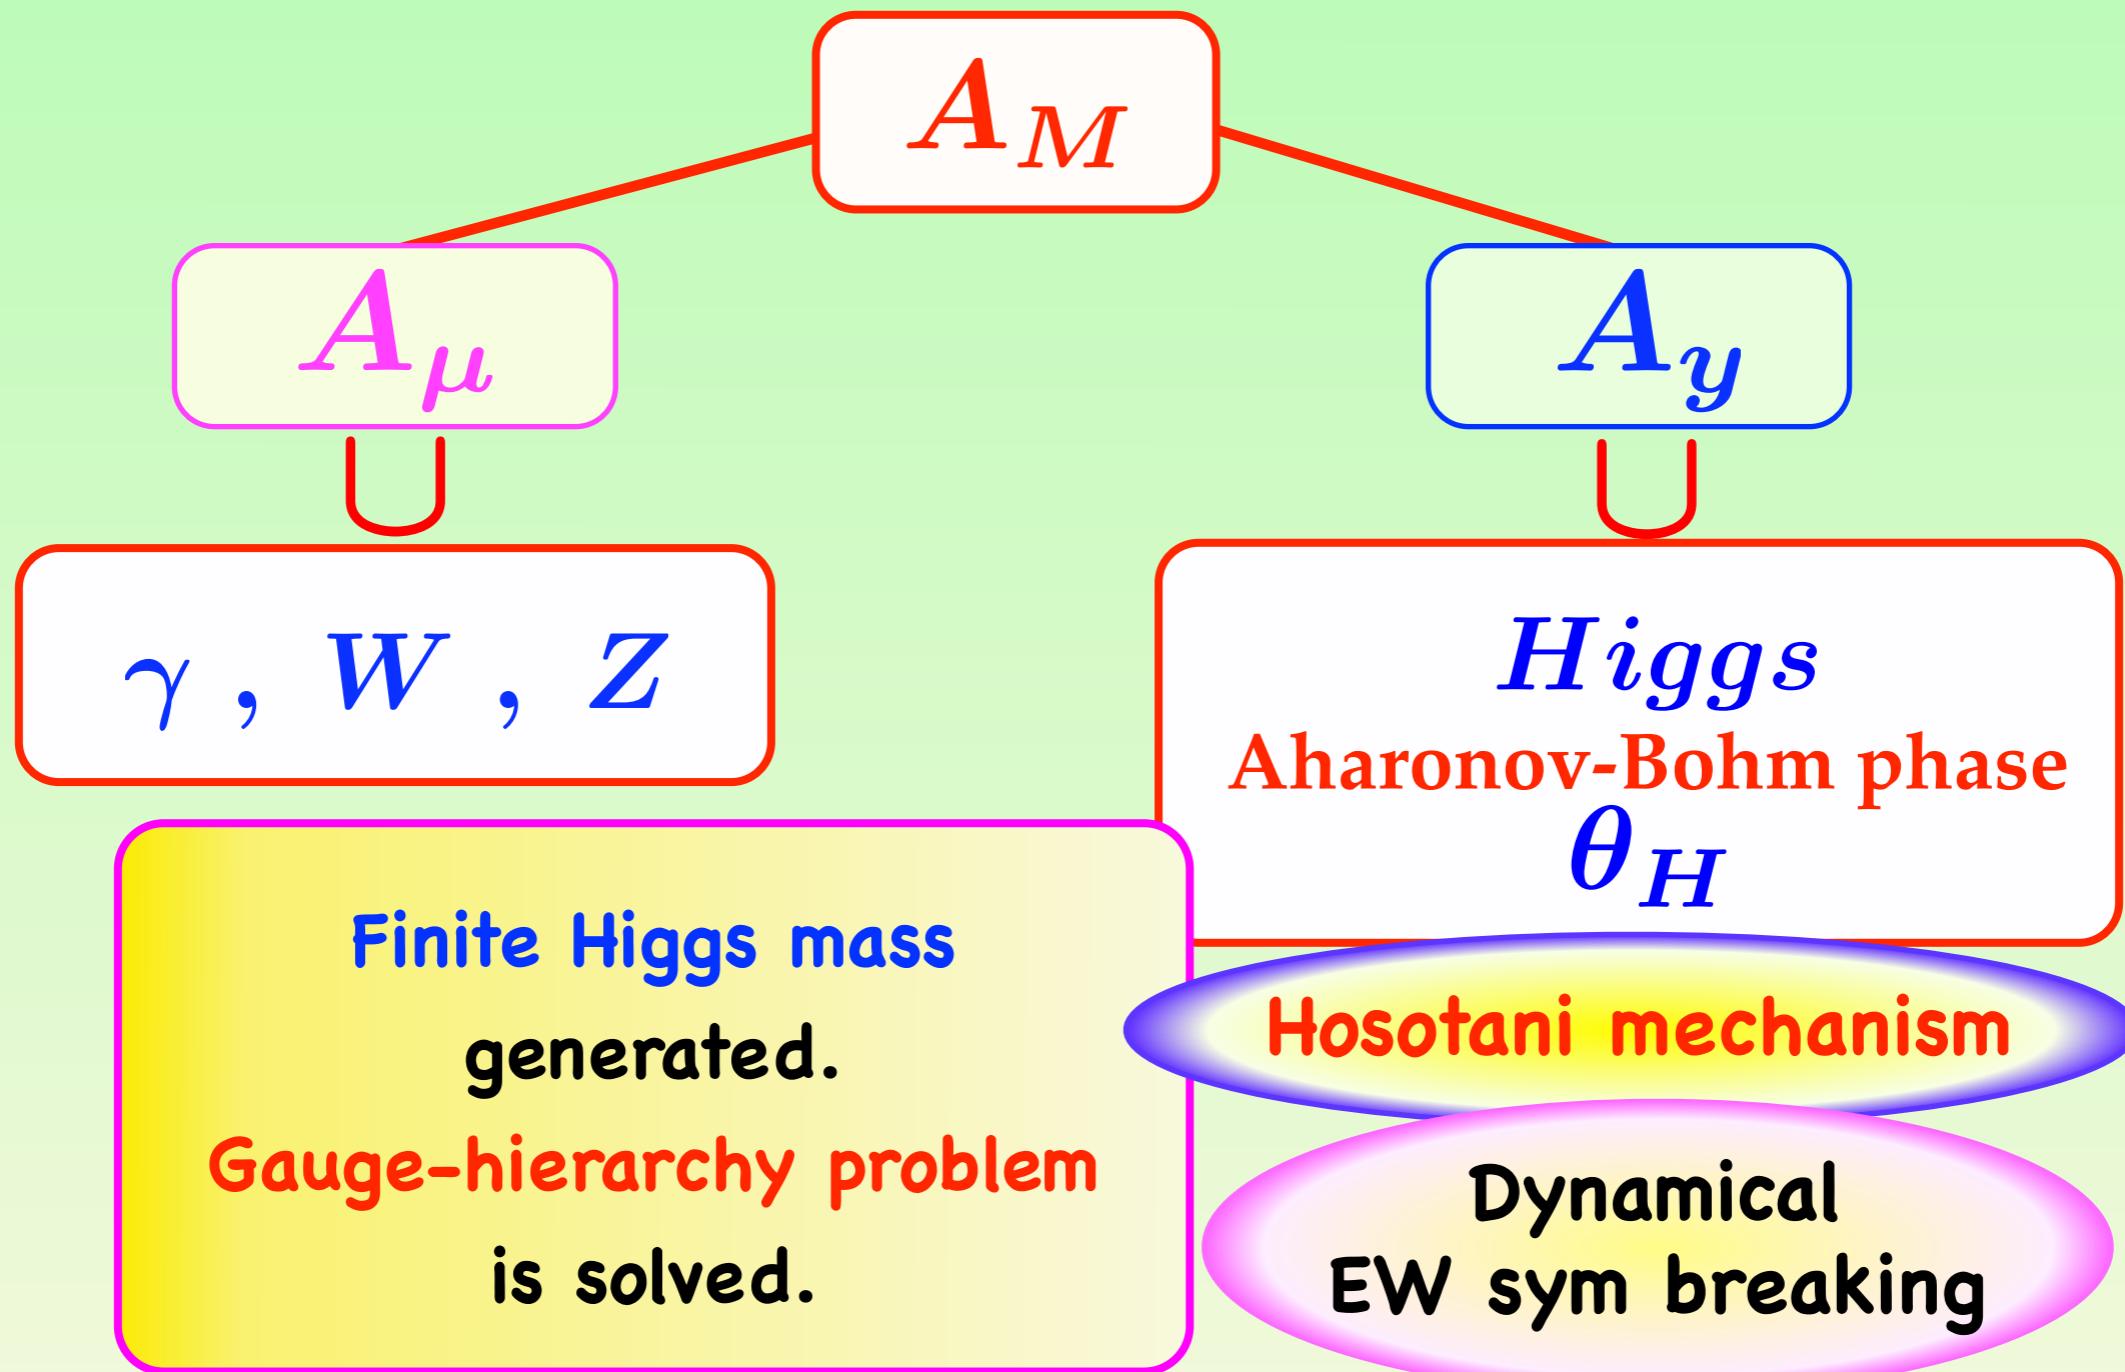

What are distinct signals of GHU ?

Theory must make predictions
& must be confirmed by experiments.

Experiments

in the past (at low energies)
LHC, ILC, ...

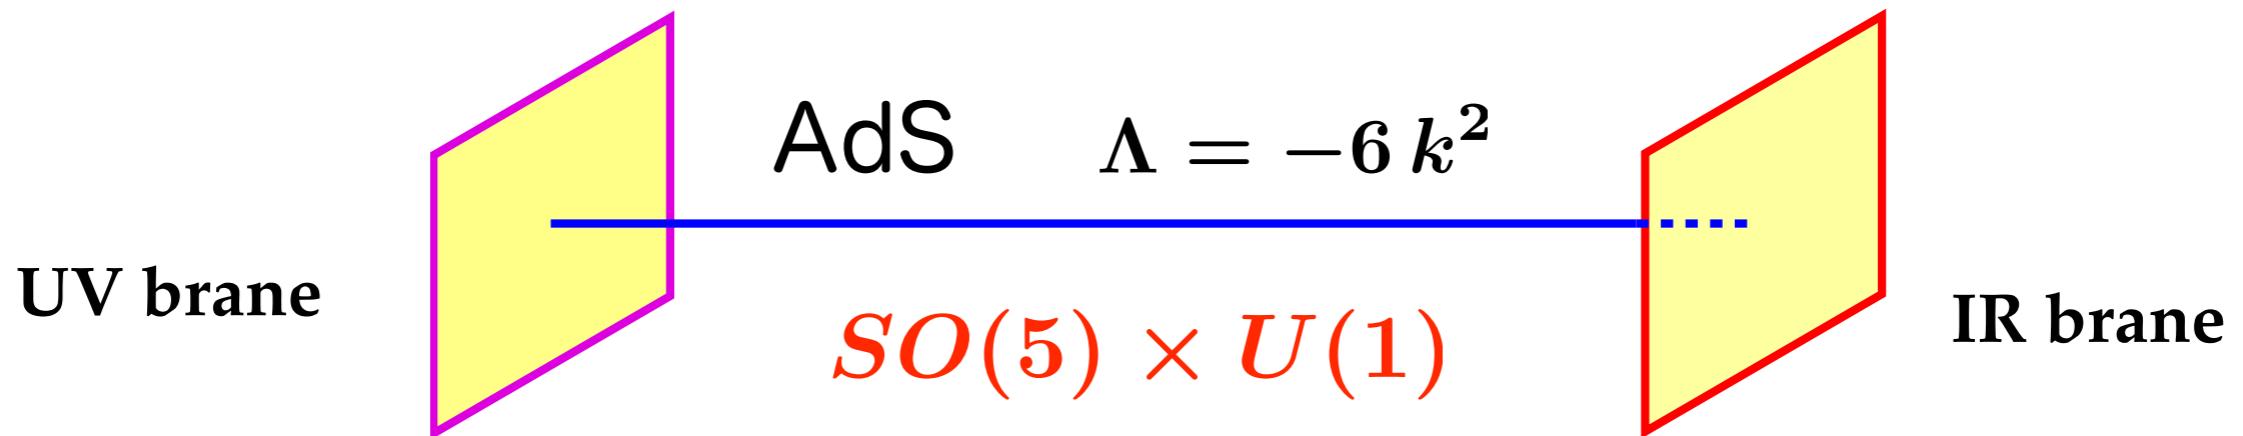

Gauge-Higgs unification

$SO(5) \times U(1)$ GHU in Randall-Sundrum

Agashe, Contino, Pomarol 2005
YH, Sakamura 2006
Medina, Shah, Wagner 2007
YH, Oda, Ohnuma, Sakamura 2008
Funatsu, Hatanaka, YH, Orikasa, Shimotani 2013

$$ds^2 = e^{-2k|y|} dx^\mu dx_\mu + dy^2$$

$$\begin{pmatrix} A_\mu \\ A_y \end{pmatrix} (x, y_j - y) = P_j \begin{pmatrix} A_\mu \\ -A_y \end{pmatrix} (x, y_j + y) P_j^\dagger$$

$$(y_0, y_1) = (0, L)$$

4D gauge bosons and Higgs

$$P_0 = P_1 = \begin{pmatrix} -1 & & & \\ & -1 & & \\ & & -1 & \\ & & & -1 \\ & & & +1 \end{pmatrix}$$

$$SO(5) \rightarrow SO(4) \simeq SU(2)_L \times SU(2)_R$$

$$A_\mu \sim \left(\begin{array}{c} \text{W} \quad \text{Z} \quad \gamma \end{array} \right)$$
$$A_y \sim \left(\begin{array}{c} \text{Higgs} \\ \text{---} \end{array} \right)$$
$$e^{i\hat{\theta}_H(x)} \sim P \exp \left\{ ig \int dy A_y \right\}$$

Predictions for LHC/ILC

Nearly the same as SM at low energies

gauge couplings of quarks/leptons~SM

	g_{GHU}/g_{SM} ($\theta_H = 0.115$)
W to $\ell\nu$, ud , cs	1.00019
$t b$	0.9993
WWZ	0.9999998

Higgs couplings to W, Z , quarks/leptons $\sim (SM) \times \cos \theta_H$

$$\cos \theta_H \sim 0.995 \text{ for } \theta_H = 0.1$$

What to look at ?

Higgs self-couplings

Deviations from SM

Extra dims → KK excitations

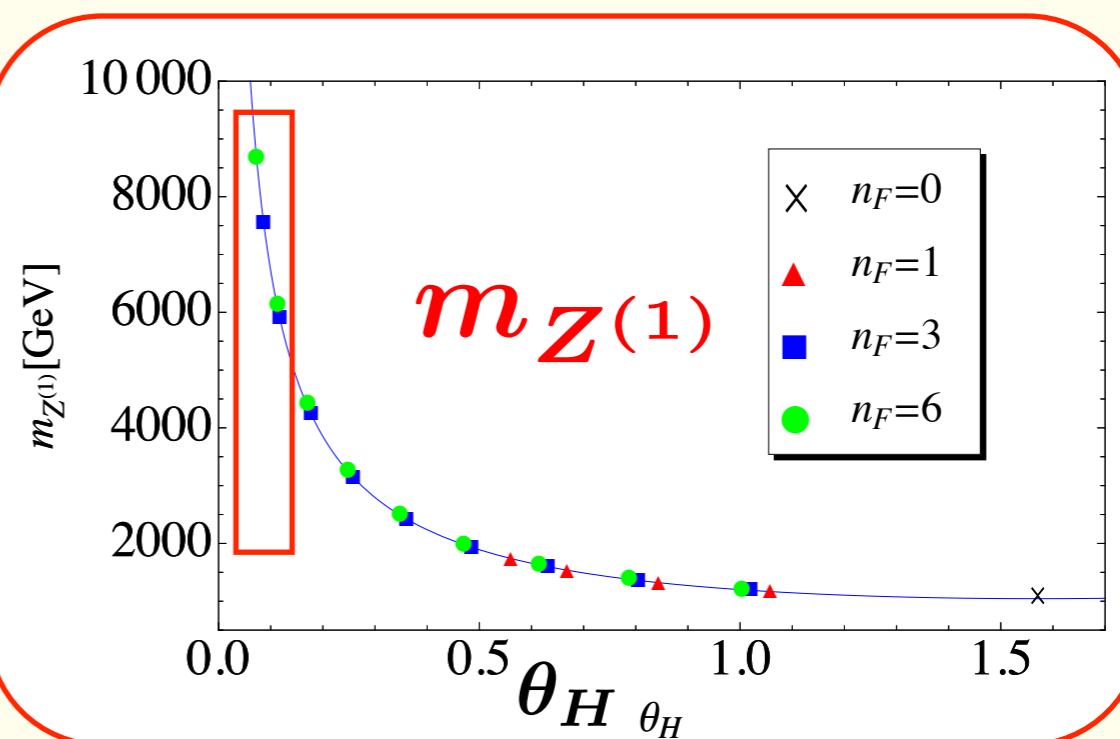

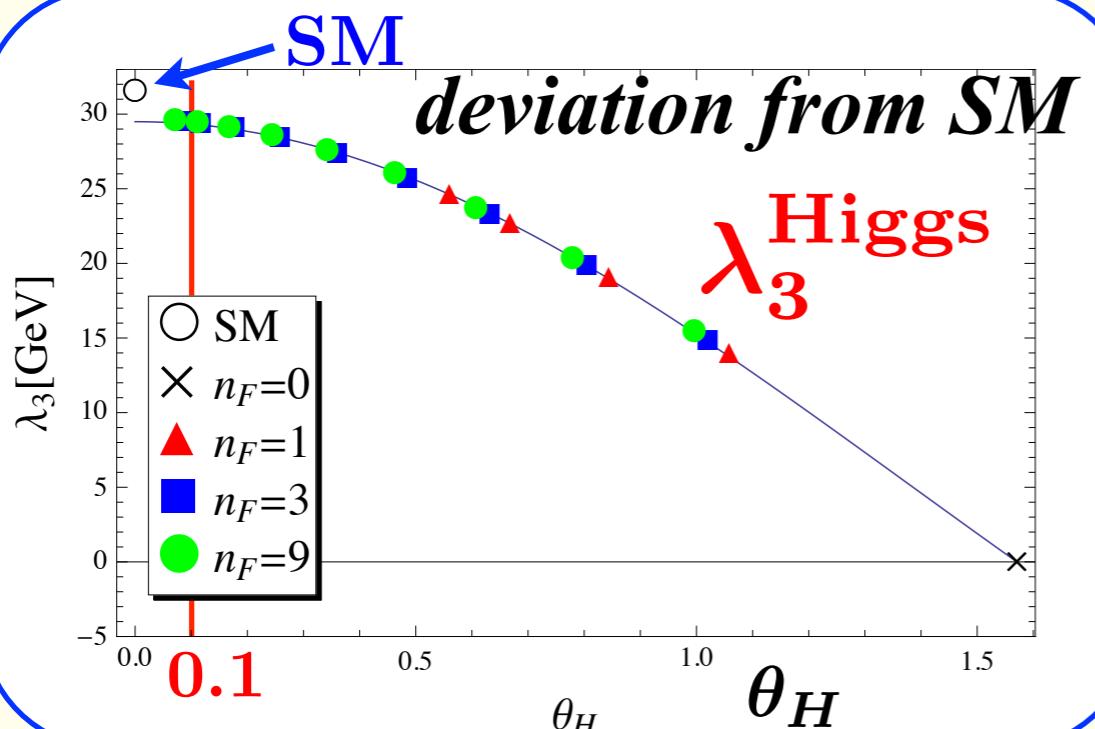

Produce new KK particles

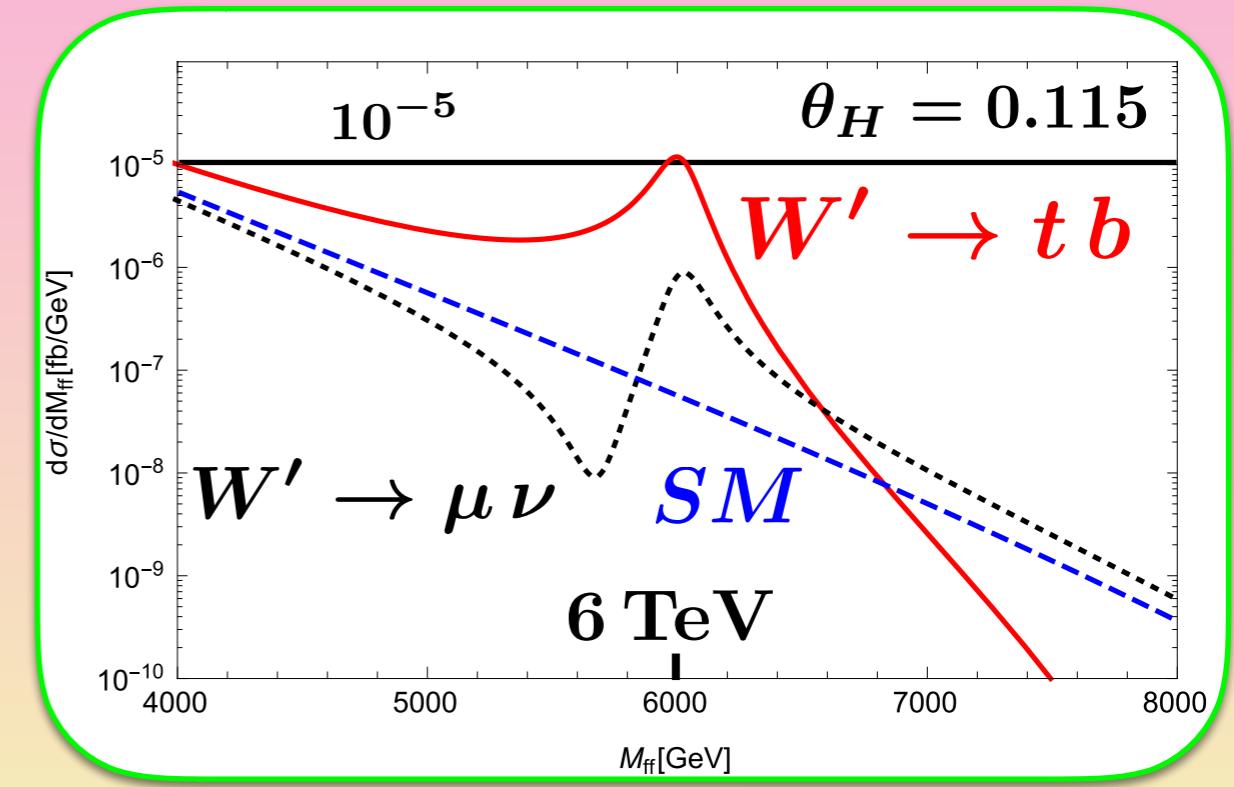

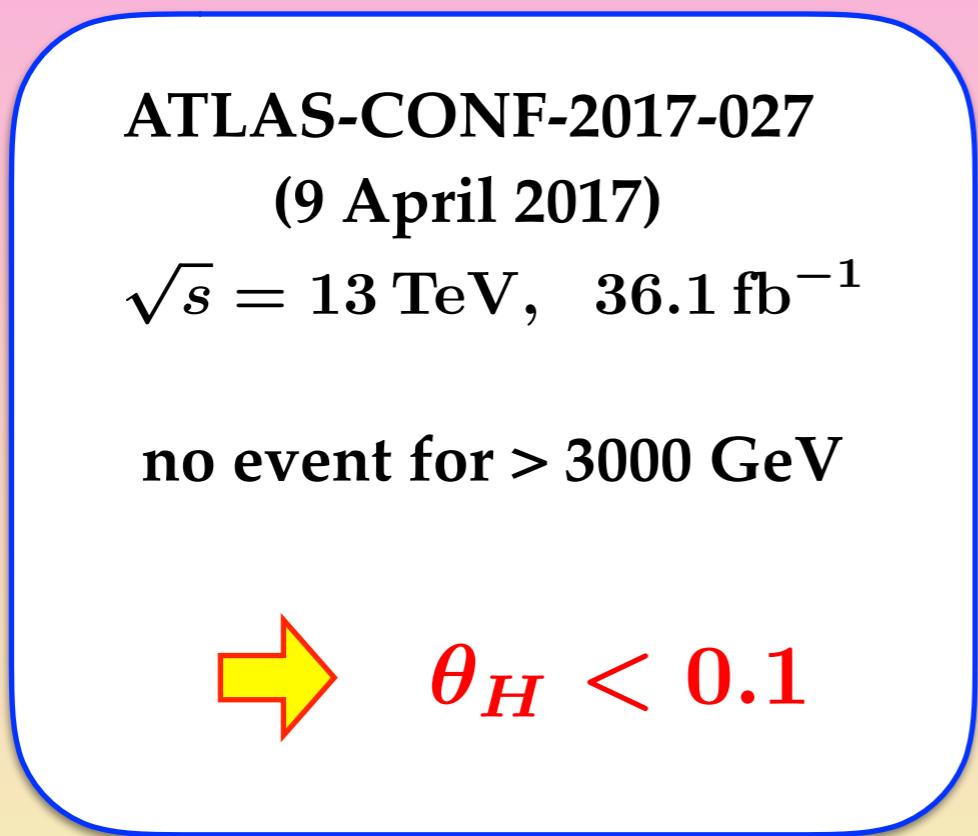

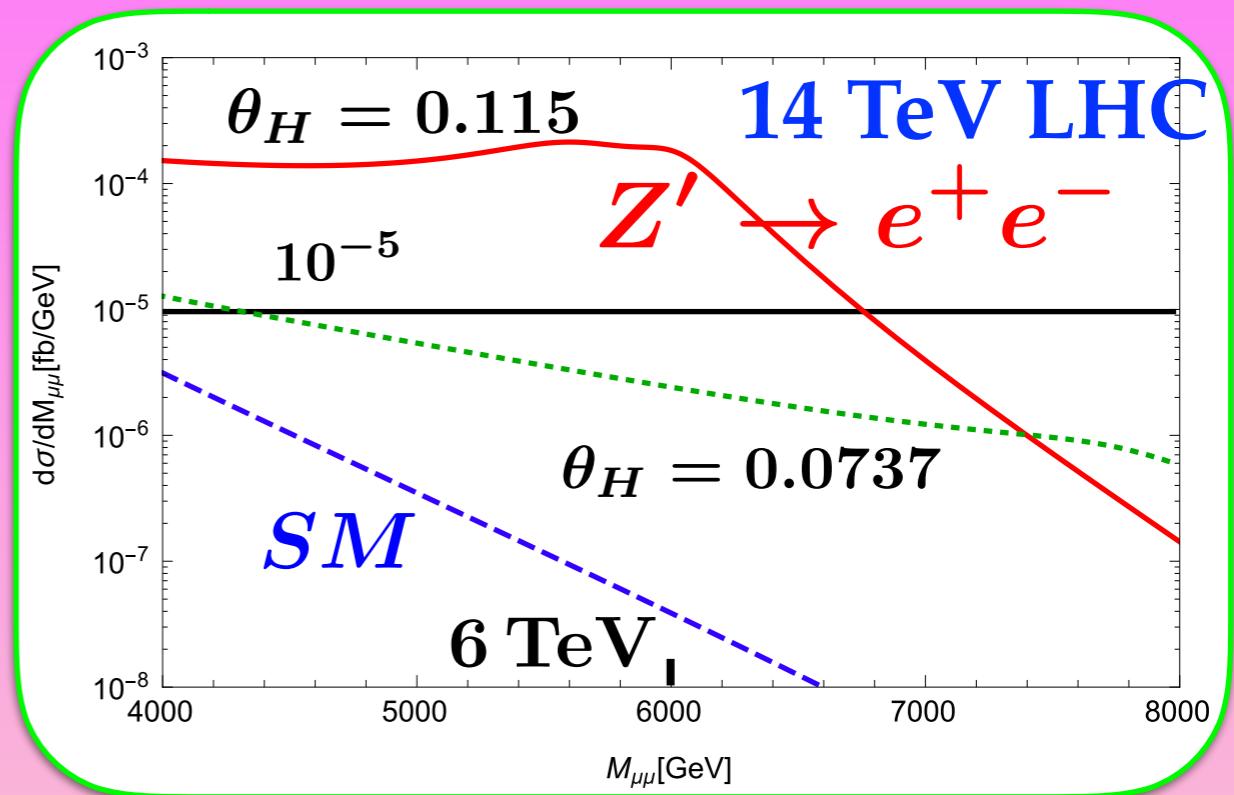

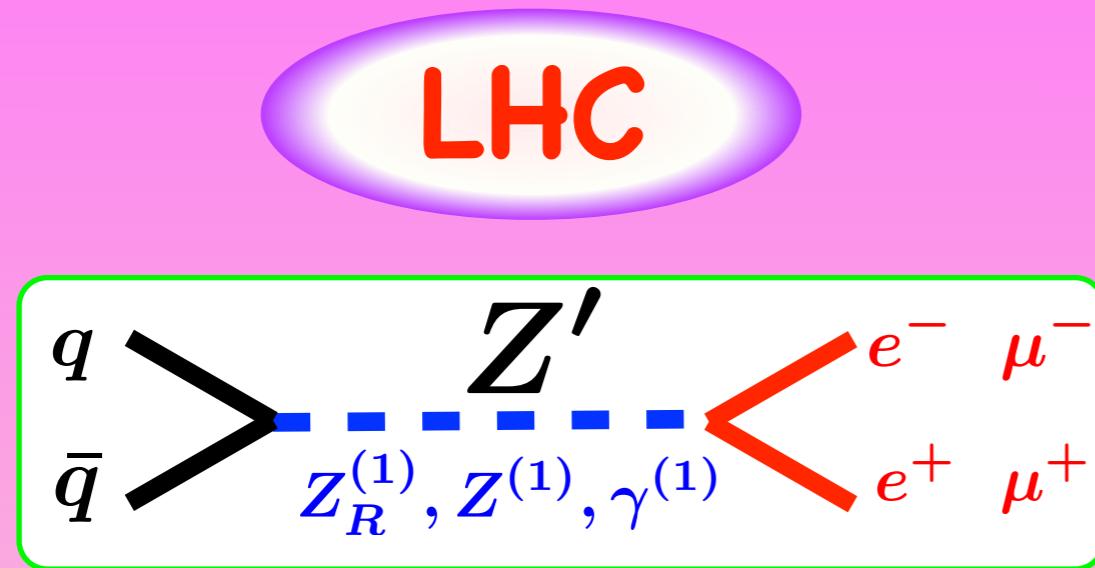

Interference effects due to KK particles

GHU is restrictive.

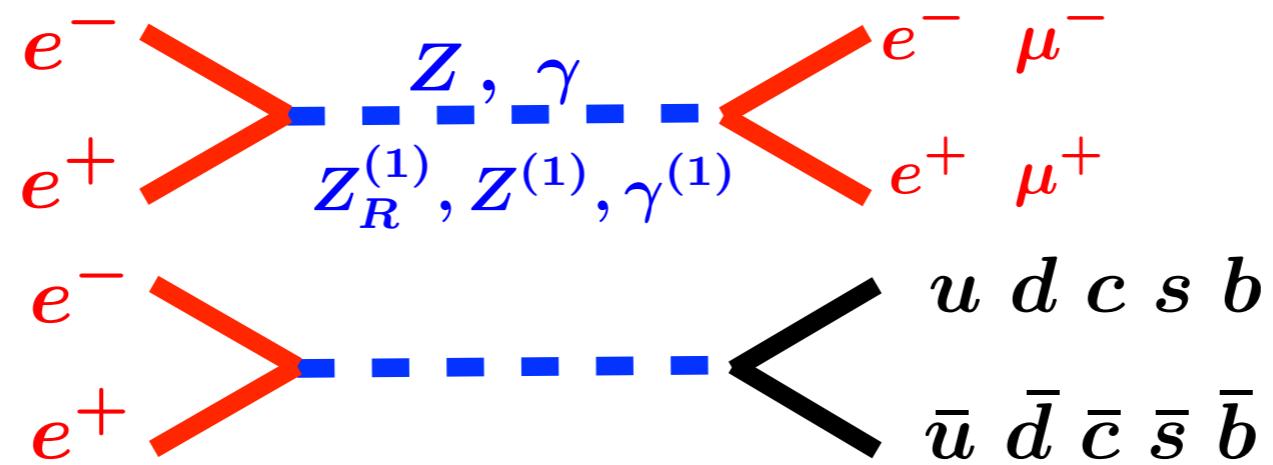

Universality

$$m_{KK}(\theta_H), m_{Z^{(1)}}(\theta_H), \lambda_3^H(\theta_H), \lambda_4^H(\theta_H)$$

ILC (e^+e^- linear collider)

Precision measurements at LEP1 & LEP2 ($\sim 207\text{GeV}$)

Energies at 250 GeV, 500 GeV, 1 TeV
Polarized electron/positron beams

In GHU, right-handed quarks/leptons
have large couplings to Z' .

Couplings to Z'

Wave functions of f_R , Z' : localized near IR brane **large**
 f_L : localized near UV brane **small**

f	Z		Z'					
	g_{Zf}^L	g_{Zf}^R	$g_{Z^{(1)}f}^L$	$g_{Z^{(1)}f}^R$	$g_{Z_R^{(1)}f}^L$	$g_{Z_R^{(1)}f}^R$	$g_{\gamma^{(1)}f}^L$	$g_{\gamma^{(1)}f}^R$
ν_e	0.5703	0	-0.2225	0	0	0	0	0
ν_μ	0.5703	0	-0.2225	0	0	0	0	0

in unit of g_w ($\theta_H = 0.115$)

$$e^+ e^- \rightarrow \bar{f} f$$

$$\sigma(\bar{f} f)$$

$$A_{FB} = \frac{\sigma_{\text{forward}} - \sigma_{\text{backward}}}{\sigma_{\text{forward}} + \sigma_{\text{backward}}}$$

\sqrt{s} , polarization P_{e^\pm}

Interference becomes visible.

$$\sigma(P_{e^-}, P_{e^+}) = (1 - P_{e^-} P_{e^+}) \sigma(P_{\text{eff}}, 0)$$

$$P_{\text{eff}} = \frac{P_{e^-} - P_{e^+}}{1 - P_{e^-} P_{e^+}}$$

$$= 0.946 \text{ for } (P_{e^-}, P_{e^+}) = (0.8, -0.6)$$

LEP2

$130 \text{ GeV} < \sqrt{s} < 207 \text{ GeV}$

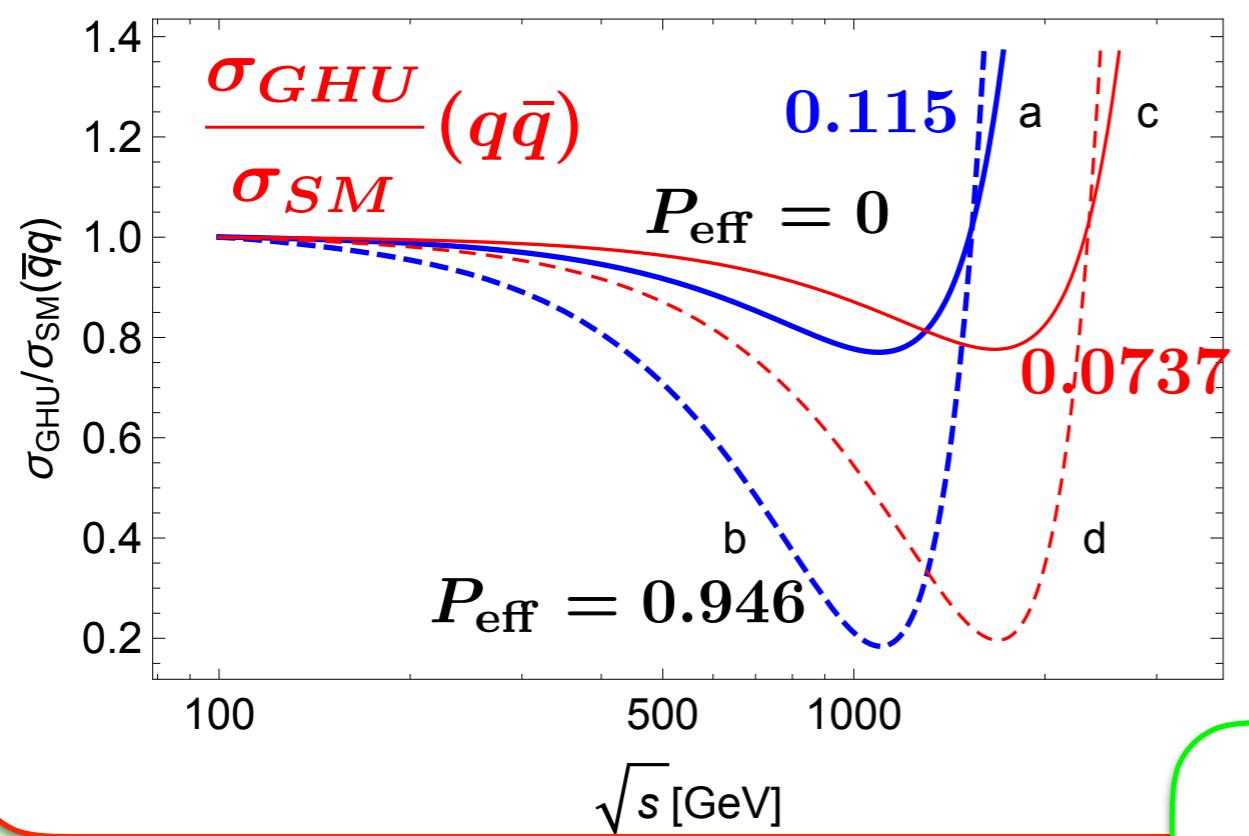

$$\frac{\sigma^{\text{exp}}}{\sigma^{\text{SM}}}(\bar{q}q) = 1.0092 \pm 0.0076$$

$\theta_H :$ 0.115 0.0737

$$\frac{\sigma^{\text{GHU}}}{\sigma^{\text{SM}}}(\bar{q}q)$$

0.9972	0.9987	at $\sqrt{s} = 130 \text{ GeV}$
0.9868	0.9944	at $\sqrt{s} = 207 \text{ GeV}$

$$\rightarrow \theta_H < 0.1$$

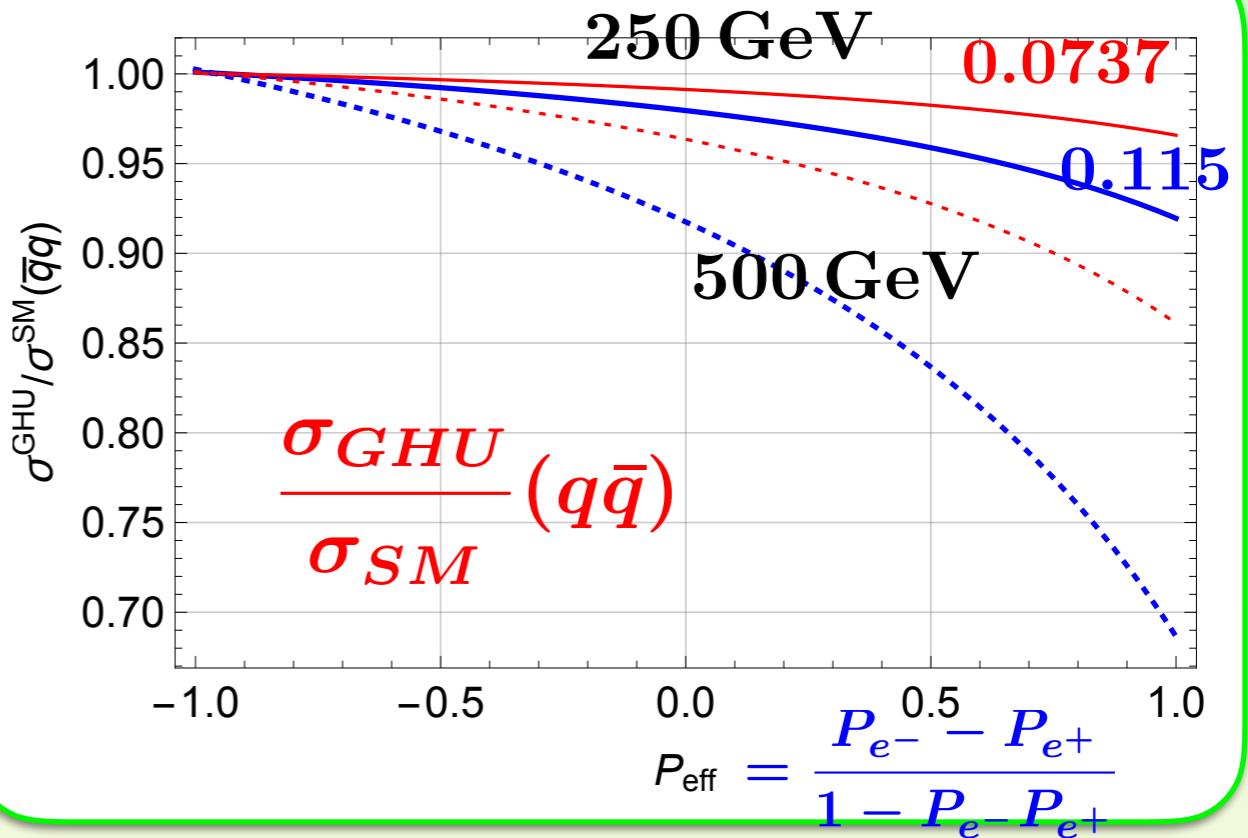

ILC

$$\frac{\sigma^{\text{GHU}}}{\sigma^{\text{SM}}}(\bar{q}q)$$

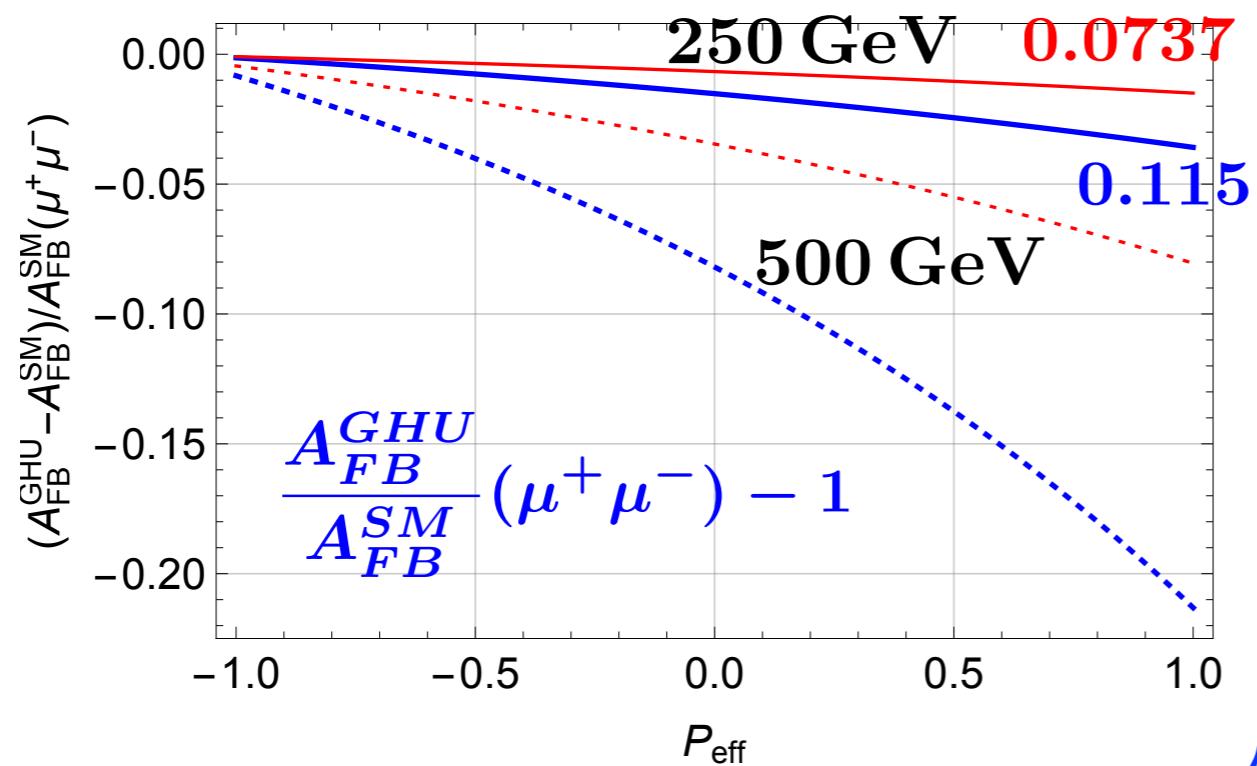

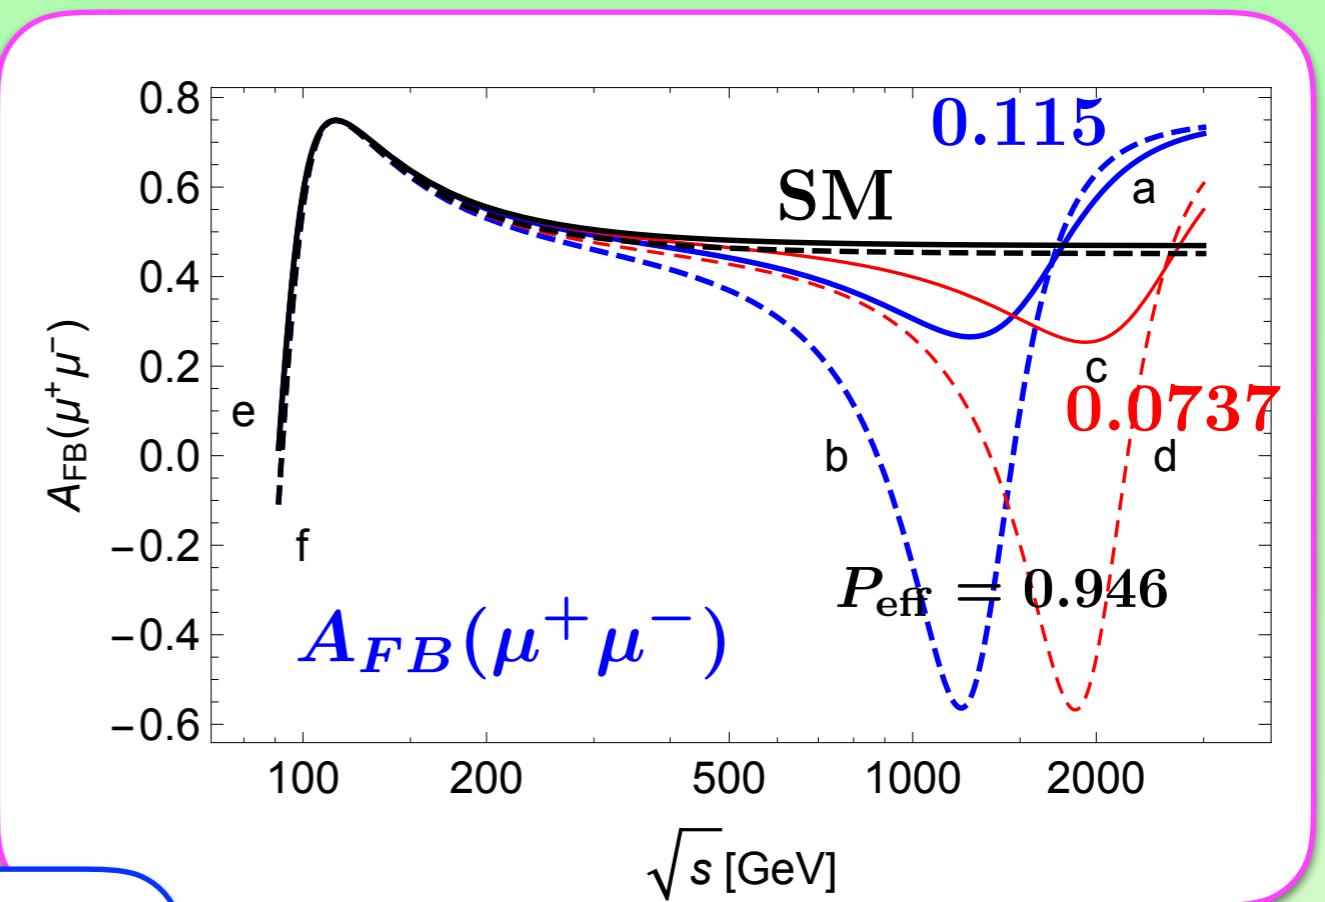

$q = u, d, s, c, b$

Measurable deviations even at 250GeV

ILC

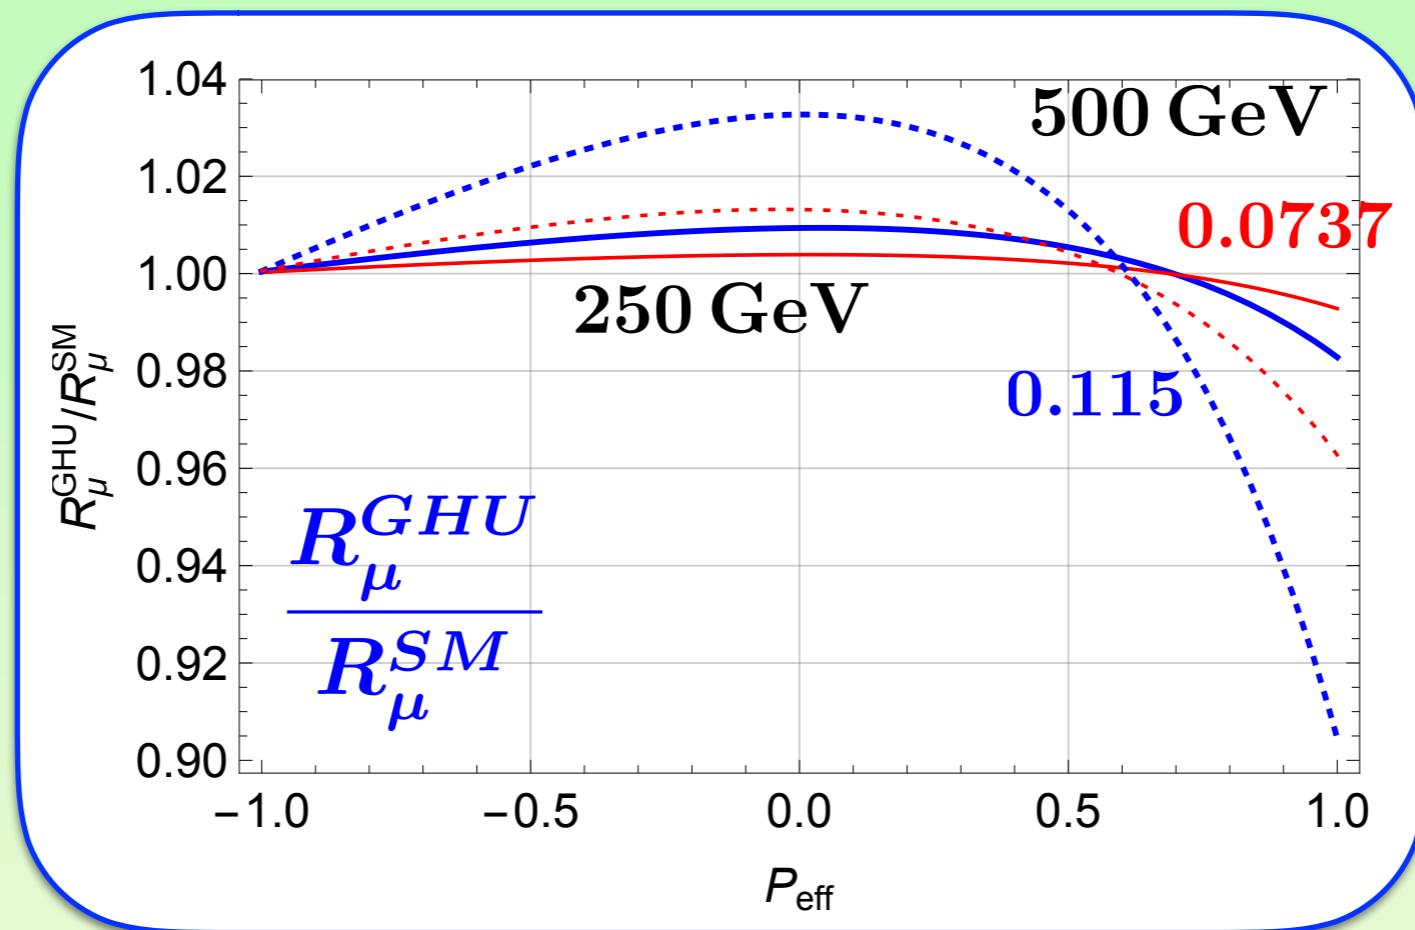

$A_{FB}(\mu^+ \mu^-)$

**Distinct
deviations**

ILC

$$R_\mu = \frac{\sigma(\bar{q}q)}{\sigma(\mu^+\mu^-)}$$

Distinct deviations

Summary

*Distinct signals of the gauge-Higgs unification
can be seen
in e^+e^- collider experiments*
