$$a_\mu^{\text{exp}} - a_\mu^{\text{theo}} \simeq (25 \pm 6) \times 10^{-10} \simeq \Delta a_\mu^{\text{BSM}} ?$$

# Motivation

- There are many BSM scenarios that can explain the  $(g-2)_\mu$  anomaly:

Leptoquarks,  $Z'$ , VLL, 2HDM, axion, ..

- Supersymmetry is particularly motivated since it offers:

Coupling Unification, Radiative EWSB, Baryogenesis, DM, ...

- There are many studies on SUSY  $g-2$  already:

[Athrona, Balazsa, Jacoba, Kotlarskic, Stockinger, Stockinger-Kim]; [Chakraborti, Heinemeyer, Saha]; [Endo, Hamaguchi, Iwamoto, Kitahara]; [Cox, Han, Yanagida]; [Baum, Carena, Shah, Wagner]; [Badziak, KS]; [Hagiwara, Ma, Mukhopadhyay'18], ...

- Most studies assume the neutralino is the Lightest SUSY Particle (LSP) and stable.

**Q:** What happens if neutralino is unstable? (e.g. RPV, Gravitino LSP)

**A:** DM constraints go away, but LHC constraints change. **How?**

		QED	HVP	EW		
$a_\mu^{\text{theo}}$	=	0.00	1165	91	810	(43)
$a_\mu^{\text{exp}}$	=	0.00	1165	92	061	(41)

- The deviation is size of the EW correction in SM:

$$a_\mu^{\text{exp}} - a_\mu^{\text{theo}} \simeq (25 \pm 6) \times 10^{-10} \sim \mathcal{O} \left( \Delta a_\mu^{\text{SM,EW}} \right)$$

- We need **very light BSM particles** **OR** **enhancement from couplings**

$$\Delta a_\mu^{\text{BSM}} \sim \Delta a^{\text{SM,EW}} \cdot \underbrace{\left( \frac{m_W^2}{m_{\text{BSM}}^2} \right) \cdot \left( \frac{g_{\text{BSM}}}{g_{\text{SM}}} \right)}_{\mathcal{O}(1)}$$

# Chiral ( $\tan\beta$ ) enhancement in SUSY

- (g-2) operator requires chirality flip:

$$\mathcal{L}_{\text{eff}} \ni i\tilde{a}_\mu \cdot \bar{\psi}_L \sigma^{\mu\nu} \psi_R F_{\mu\nu}$$

$$\text{SM: } \tilde{a}_\mu^{\text{SM}} \propto Y_\mu \langle H \rangle = m_\mu$$

$$\vec{\mu} = g \left( \frac{e}{2m} \right) \vec{s}$$

$$m_\mu = Y_\mu \langle H_d \rangle \quad \tan\beta \equiv \frac{\langle H_u \rangle}{\langle H_d \rangle}$$

$$\langle H_u \rangle^2 + \langle H_d \rangle^2 = \langle H \rangle^2$$

- Due to strong LHC constraints, we *decouple coloured SUSY particles* (they do not contribute to  $(g-2)_\mu$  anyway).
- $a_\mu^{\text{SUSY}}$  depends on **5 mass parameters** and  **$\tan\beta$**  :

## Constraints:

❖ Stau mass<sup>2</sup> becomes negative or too small!

- charge breaking vacuum:  $m_{\text{stau}1}^2 > 0$

- LEP bound:  $m_{\text{stau}1} > 90 \text{ GeV}$

- stau LSP:  $m_{\text{stau}1} > m_{\text{neutralino}1}$

- Allowing both **B** and **L** violation leads to a rapid proton decay:
- We introduce only the **UDD** operator with:  $\lambda''_{112} \neq 0$
- Constraint from K0-K0bar mixing can easily be satisfied:

$$|\lambda''_{112} \lambda''_{123}| \lesssim 2.8 \times 10^{-2} \left( \frac{m_{\tilde{s}_R, \tilde{u}_R}}{1 \text{ TeV}} \right) \quad [1810.08228]$$

# Gravitino LSP

- In the gauge-mediated SUSY breaking (GMSB) scenario, **light gravitino is motivated by naturalness:**

$$\delta m_h^2 \propto m_{SUSY}^2 \ln \left( \frac{\Lambda_{\text{mess}}}{M_{\text{PL}}} \right) \quad m_{3/2} = \frac{4\pi}{\sqrt{3}\alpha_W} M_2 \frac{\Lambda_{\text{mess}}}{M_{\text{PL}}}$$

- The decay rate of the NLSP neutralino into the gravitino can be calculated. For light gravitinos ( $< 10\text{-}100$  eV), the **neutralino decays are prompt.**

$$\Gamma(\tilde{\chi}_1^0 \rightarrow \tilde{G}\gamma) = |N_{11}c_W + N_{12}s_W|^2 \mathcal{A},$$

$$\Gamma(\tilde{\chi}_1^0 \rightarrow \tilde{G}Z) = \left( |N_{12}c_W - N_{11}s_W|^2 + \frac{1}{2}|N_{13}c_\beta - N_{14}s_\beta|^2 \right) \left( 1 - \frac{m_Z^2}{m_{\tilde{\chi}_1^0}^2} \right)^4 \mathcal{A},$$

$$\Gamma(\tilde{\chi}_1^0 \rightarrow \tilde{G}h) = \frac{1}{2}|N_{13}c_\beta + N_{14}s_\beta|^2 \left( 1 - \frac{m_h^2}{m_{\tilde{\chi}_1^0}^2} \right)^4 \mathcal{A},$$

$$\mathcal{A} = \frac{m_{\tilde{\chi}_1^0}^5}{16\pi m_{3/2}^2 M_{\text{pl}}^2} \sim \frac{1}{0.3 \text{ mm}} \left( \frac{m_{\tilde{\chi}_1^0}}{100 \text{ GeV}} \right)^5 \left( \frac{m_{3/2}}{10 \text{ eV}} \right)^{-2}$$

● small  $|\mu|$  region is compatible with  $(g-2)_\mu$

# Summary

- SUSY might be a solution to the  $(g-2)_\mu$  anomaly
  - stable LSP  $\tilde{\chi}_1^0 \implies$  LHC constraints from large  $\cancel{E}_T$  search
  - slepton-gaugino-Higgsino are light  $\implies$  stringent constraint from DM-DD detection
  - LR slepton and Bino are light  $\implies$  Bino overproduction
- If  $\tilde{\chi}_1^0$  is not stable LSP, DM constraints go away, and LHC signature changes.
  - ① RPV with UDD  $\implies$  LHC constraints from multijet + lepton
  - ② Gravitino LSP with  $\tilde{\chi}_1^0$  NLSP  $\implies$   $(g-2)_\mu$  region excluded by  $\gamma/\ell + E_T$  channel
  - ③ Gravitino LSP with **non**  $\tilde{\chi}_1^0$  NLSP  $\implies$  LHC constraints from soft lepton/tau

**Explanation for  $(g-2)_\mu$  anomaly is possible for the scenarios ① and ③**
